

## Power Bridge Controller Add-on

This add-on was born from the need to galvanically isolate the I2C bus.  
GND bounce and long cables brought some problems with communication with the bridges.  
This add-on implements an I2C isolator which also acts as a voltage converter.  
The add-on is implemented as a board that will attach to both heatsinks on the bridge.  
There it will act as a structure stiffener and will do temperature probing.
